3. Dataset and experimental method 3.1. Data source and quality. We consider HEAs that belong to the $Al_x Co_y Cr_z Cu_u Fe_v Ni_w$ system, where the mole fractions of each element of x, y, z, u, v and w is constrained by $x + y + z + u + v + w = 100\%$. To minimize the influence of processing on the final property, the training data assembled from the literature are for alloys fabricated by ...

A finite element (FE) model comprises a system of points, called "nodes", which form the shape of the design. Connected to these nodes are the finite elements themselves which form the finite element mesh and contain the material and structural properties of the model, defining how it will react to certain conditions.
