Ecological Succession Introductory Activity Answer

As ecological succession occurs, types of species present in a community will change in response to changing environmental conditions such as fires, climate change, and the clearing of forests to plant crops. Pioneer species arrive first. As environmental conditions change, they are replaced by other species, and later these species may be replaced by another set of species. Primary Succession: Succession that occurs on surfaces where no soil exists.

Ecological Succession Introductory Activity Answer Key

Insects appear early in succession with the first plant species, such as grasses. As succession continues, small herbivores and omnivores appear, followed by larger predators. Find links to more information about ecological succession in the View Related Resources section at the bottom of the page.

Ecological Succession | Texas Gateway

Primary succession begins in barren areas, such as on bare rock exposed by a retreating glacier. The first inhabitants are lichens or plants—those that can survive in such an environment. Over hundreds of years these “pioneer species” convert the rock into soil that can support simple plants such as grasses.
