Immune checkpoint blockade immunotherapy for cancer has been achieving increasing prominence in recent years, but, unfortunately, it still only works for a subset of patients and tumor types. Wang et al. found that higher expression of lysine demethylase KDM5A in tumors correlates with their responses to immune checkpoint inhibition. The authors then found a way to take advantage of this ...

Palliative care is care given to improve the quality of life of patients who have a serious or life-threatening disease, such as cancer. Palliative care is an approach to care that addresses the person as a whole, not just their disease. The goal is to prevent or treat, as early as possible, the symptoms and side effects of the disease and its treatment, in addition to any related psychological, social, and spiritual problems.

Enhancing Cancer Care. Having a hereditary susceptibility does not mean that a person will develop a specific cancer, but the risk of developing that cancer may be higher for that person. Consequently, the identification of BRCA1 and BRCA2 mutations has provided some important changes in breast cancer screening and prevention. Now testing for these genes in affected families can help to inform decisions about preventive treatment.
