This is a list of GIS data sources (including some geoportals) that provide information sets that can be used in geographic information systems (GIS) and spatial databases for purposes of geospatial analysis and cartographic mapping. This list categorizes the sources of interest.

List of GIS data sources - Wikipedia

Primary and Secondary Data Sources One way to characterize data in geography concerns whether they were collected specifically for the purpose of a researcher's particular study. If so, we call the data primary. An example would be a geographer who interviews people about their attitudes toward bioengineered agriculture.

However, it is important to note that specific characteristics of government data varies greatly across North America. Attribute data has an even wider variety of data sources. Any textual or tabular data than can be referenced to a geographic feature, e.g. a point, line, or area, can be input into a GIS.

SOURCES OF DATA

In developing a digital topographic database for a GIS, topographical maps are the main source, and aerial photography and satellite imagery are extra sources for collecting data and identifying attributes which can be mapped in layers over a location facsimile of scale.

Geographic information system - Wikipedia

Some examples of geographic data formats Geographic Data Formats One of the biggest problems with data obtained from external sources is that they can be encoded in many different formats. Many GIS software systems are now able to read directly Auto CAD DWG and DXF, Microstation DGN, and Shapefile, VPF, and many image formats.

THE NATURE AND SOURCE OF GEOGRAPHIC DATA

ADVERTISEMENT: Concerned with the regional differences in the earth's covering of people and their characteristics, population geography is basically an empirical science. In order to achieve the objectives, it is necessary for a population geographer to have data or facts on human population. There are two main aspects of population on which geographers generally require [...]
