Placenta praevia is when the placenta attaches inside the uterus but in an abnormal position near or over the cervical opening. Symptoms include vaginal bleeding in the second half of pregnancy. The bleeding is bright red and tends not to be associated with pain. Complications may include placenta accreta, dangerously low blood pressure, or bleeding after delivery.

### **Placenta praevia - Wikipedia**

The uterus (from Latin "uterus", plural uteri) or womb (/ w u: m /) is a major female hormone-responsive secondary sex organ of the reproductive system in humans and most other mammals. In the human, the lower end of the uterus, the cervix, opens into the vagina, while the upper end, the fundus, is connected to the fallopian tubes. It is within the uterus that the fetus develops during gestation.

### **Uterus - Wikipedia**

Definition: Contrast induced nephropathy (CIN) is a condition in which a decrease in renal function occurs within 3 days of the intravascular administration of a CM in the absence of an alternative aetiology. An increase in serum creatinine by more than 25% or 44 µmol/l (0.5 mg/dl) indicates CIN.

The first trimester screening is a combination of two blood tests and a special ultrasound that are used to assess a pregnant woman's risk of carrying a baby with Down syndrome (trisomy 21) or Edwards syndrome (trisomy 18). Performing and evaluating them together, plus considering the woman's age, increases both the sensitivity and specificity of the screening results.

After a proliferating phase in the 1st few months, a slow but constant regression (involuting phase) can be seen, with the process usually being completed by 7–10 years of age . During that time, the hemangioma changes color to grayish dark red, loses its toughness, and alters in shape, developing into a fibrofatty residuum ( 10 , 15 ).
