For new designs only the general tolerance according to DIN ISO 2768-1 should be valid. The limit measurements of the tolerance classes m and f of DIN ISO 2768-1 are identical with those of DIN 7168-1. According to DIN ISO 2768-2. DIN ISO 2768-2 is for simplifying drawing and fixes general tolerances in three tolerance classes for form and position. By choosing a special tolerance class exactly the precision level common in workshops should be taken into account.

It is not possible to define tolerance against each dimension. Therefore variation in dimension without tolerance is defined using general tolerance. ISO 2768 has defined general tolerance for: Linear Dimensions; Angular Dimension; External Radius and Chamfer height; Geometric Tolerance such as straightness, flatness, perpendicularity, symmetry and runout.

These tolerance values would be automatically achieved by machining in a workshop with a customary accuracy equal to or finer than ISO 2768-mH and would not normally require to be inspected. 2 As some tolerances also limit the deviations of other characteristics of the same feature, straightness deviations, not all general tolerances are shown in the interpretation above.
