Wild Reptiles: Snakes, Crocodiles, Lizards, and Turtles ...

Reptiles are a group of tetrapod animals within the class Reptilia, comprising today's turtles, crocodilians, snakes, amphisbaenians, lizards, tuatara, and their extinct relatives. The study of these traditional reptile orders, historically combined with that of modern amphibians, is called herpetology. Because some reptiles are more closely related to birds than they are to other reptiles (e.g., crocodiles are more closely related to birds than they are to lizards), the traditional groups of ...

Snakes probably evolved from lizards (when their legs retreated due to unemployment) and are exclusively carnivores. Snakes and lizards can best be seen on sunny days, when they are active. Many lizards have an interesting self-preserving mechanism: when grabbed forcefully by the tail, they can break it off. This is known as "tail autonomy" and can actually be observed with many lizards (e.g. geckos).
