The Arduino is a very simple processor with no operating system and can only run one program at a time. Unlike your personal computer or a Raspberry Pi, the Arduino has no way to load and run multiple programs. That doesn't mean that we can't manage multiple tasks on an Arduino. We just need to use a different

Getting Started With Arduino- (Part 1/49)

Many servos go below 1 ms and beyond 2 ms. E.g. many Hitec servos have a range of 0.9...2.1 ms. Check the data sheet of your servos for details. If you do not have a data sheet, then you might just experiment with different values. With a PWM duty of 1 ms to 2 ms within a 20 ms period, this means that
